(A) ordinary differential equations (ODE) (B) partial differential equations (PDE) An ordinary differential equation is that in which all the derivatives are with respect to a single independent variable. Examples of ordinary differential equations include  $y'' + y = 0$ ,  $y'' + 2y' + 2y = 0$ ,  $y'' = 4y$ ,  $y'' + 3y' + 5y = \sin x$ ,  $y'' + 2y' + 3y = 3x$ . Ordinary differential equations are classified in terms of order and degree.

### **A Primer on Ordinary Differential Equations**

Ordinary differential equations are classified in terms of order and degree. Order of an ordinary differential equation is the same as the highest derivative and the degree of an ordinary differential equation is the power of highest derivative.

### **A Primer for Ordinary Differential Equations**

This textbook is designed with the needs of today's student in mind. It is the ideal textbook for a first course in elementary differential equations for future engineers and scientists, including mathematicians. This book is accessible to anyone who has a basic knowledge of precalculus algebra and differential and integral calculus.

In Differential Equations, you spend a lot of time studying ODEs. This primer focuses on a specific subset of material from that course and presents one unified way to solve all such problems.

OVERVIEW In Section 4.7 we introduced differential equations of the form  $y' = f(x, y)$ , where  $f$  is given and  $y$  is an unknown function of  $x$ . When  $f$  is continuous over some interval, we found the general solution by integration. In Section 7.5 we solved separable differential equations.
