Introduction to solid mechanics. 2 Lecture on 6 September 2013 In this course on solid mechanics we will

only consider the linear part of the stress/strain relationship. Stress and strain are defined as $\text{Stress} = \frac{F}{A}$ and $\text{Strain} = \frac{\Delta L}{L}$. Linear elasticity is a material model or a constitutive law.

called the normal stress. Water at the base of a pond, air in an automobile tire, the stones of a Roman arch, rocks at base of a mountain, the skin of a pressurized airplane cabin, a stretched rubber band and the bones of a runner all support force in that way (some only when the force is compressive).

An Introduction to Mechanics of Solids by Stephen H. Crandall is based on the understanding and application of three fundamental physical considerations which govern the mechanics of solids in equilibrium. All the discussion and theoretical development is explicitly related to these three basic considerations.
