rigid structures, and the stiffness properties for semi-rigid analysis are directly adopted for push-over analysis. B. AKBAS.et.al.(2003) conducted a push over analysis on steel structures to estimate the seismic demands at different performance levels, which requires the consideration of the inelastic behavior of the structure.

pushover methods and also the results of nonlinear time history analyses. The validation studies are based on evaluation of three existing steel moment frame buildings: two of these structures were instrumented during the Northridge earthquake thereby providing realistic support motions for the time-history predictions.

Although pushover analyses of concrete structures and steel structures have been carried out by many researchers and designers, at present, to the author's knowledge, pushover analyses for the seismic analysis of base-isolated steel-concrete composite structures are rarely reported in the technical literature.
